# C Coding Guidelines

- snake\_case: easier to type, harder to read
  - Though: some of the best ever written softwares were made in  $snake\ case$
- camelCase: harder to type, easier to read
  - Microsoft uses it...
- Dividing the code in functions increase its comprehension and readability.
- Code must not be generic, but very specific to what exactly you're doing.
- Code for debug purpose must be removed from the final form of the code.

## Variables

```
Local: {name_of_var}
Global: g_{detailed_name_of_var}
int i;
extern int g_alien_cnt;
```

## **Functions**

## Names

```
{libLabel}_{object}[_]{action_or_verb} or {libLabel}_{action_or_verb}_{object} sfSyl_welcome_txt_print () sfSyl_print_welcome_txt () ______
```

test	test
lol	lel

#### **Definitions**

```
test test

**[attributes ]{type} lel

{function_name}( {args} )

{
/.../
}**
```

noreturn void

```
usage( int status )
    /*...*/
   exit( status );
  • Rationale: easier to grep ("^func_name") ## Pointers {type} *{var}
int *var1, *var2; /* 2 pointers */
int *var1, var2;
                 /* 1 pointer, 1 int ! */
Typedefs
[libLabel\_]{name}\_t
superint_t i;
sfs_superint_t j;
Structures
\{name\_of\_struct\}\_s, \{name\_of\_struct\_var\}
datstruct_s this_is_a_struct;
Enums
{name_of_enum}_e, {ENUM_CONST}, {name_of_enum_var}
enum mood_e { TAKE_IT, GIVE_IT, KEEP_IT } my_mood;
Gotos
[GT_{}]{ThisPart} or [GT_{}]{this\_part}
EmergencyClosure:
GT_EmergencyClosure:
GT_emergency_closure:
Define
[TYPE_]{NAME_OF_DEF}
#define ALIENS_ON_PLANET_CNT
                               1234
```

```
Macro (DEFINES)
[M_]{OBJECT}_{VERB} or [M_]{VERB}_{OBJECT}
#define ALIENS_ON_PLANET_LOCATE ()
#define M_ALIENS_ON_PLANET_LOCATE ()
#define LOCATE_ALIENS_ON_PLANET ()
Macro (header guars)
{NAME_OF_HEADER}_H
MY_COOL_LIB_H
  • Rationale: \_ and \_\_-starting header guars are used by standard library
    headers ## Parenthesis / braces {func}( {args} );
printf( "spaces btwn args and parenthesis : %d", true_dat );
{statement} ({condition}) {
/.../
if (true_dat == 1) {
   /*...*/
} else {
   /*...*/
Code example
#ifndef THAT_GUARD_THOUGH_H
#define THAT_GUARD_THOUGH_H
#include "myheader.h"
#include <header1.h>
#include <header2.h>
#define STR_SIZE_OF_PLANET "BIG"
noreturn void
f_datFunc( void )
   unsigned int aliens_cnt = 100;
   int happn = 0;
```

```
printf( "This planet is %s.\n", STR_SIZE_OF_PLANET );
    if (aliens_cnt > 50) {
        puts( "it's happening" );
        happn = 1;
    } else if (aliens_cnt > 0) {
        puts( "we still have time" );
        happn = 0;
    } else { puts( "ERROR" ); goto GT_Habbening; }
    switch (happn) {
    case 0:
        return( EXIT_SUCCESS );
    default:
    GT Habbening:
        return( EXIT_FAILURE );
    }
}
            /* ndef _THAT_GUARD_THOUGH_ */
#endif
```

## General advices

- Always use header guards.
- Put braces even on one-line statements.

## Linux kernel coding style

GNU indent now has an option to format your code according to the Linux kernel

coding style: indent -linux [file]. Doc: https://www.kernel.org/doc/html/v4.10/process/coding-style.html
